Elgato HD60S is an external recording card that can be used to record or stream console games through a computer. While many people capture slot in the PCI-E slot on your computer, the HD60S is external, which means you can use your laptop. In this guide, we explain how you can use an Elgato HD60S with your laptop. We will go through each step so you can make sure you get the process right. Most of the time, you just need to have the right software on your computer and connect things correctly. If you're using a PS4, you'll need to follow one step before the HD60S works. We explain everything below. Installation console for recording or streaming First, if you are using a PS4, you must first turn off HDCP on the settings menu. To do this, turn on PS4 and then navigate to the settings menu. Navigate to the bottom of the settings menu and select System. From there, deselect the Enable HDCP option. Restart PS4. Restart your PS4. Then visit Elgato to download the necessary software. You need to restart your laptop after installation. Once you've done that, it's time to connect your PS4 to your laptop. For this to work, you'll need an HDMI cable and the included USB-C to USB 3.0 cable included with the Elgato HD60S. Your laptop must have the following specifications. A USB 3.0 or 3.1 port A HDMI port After confirming that your laptop has these elements, take your Elgato HD60S and connect it to your console via the HDMI in port. Next, you need to connect the USB-C port on the Elgato HD60S to a free USB 3.0 or 3.1 port on your laptop. Note: It must be 3.0 or higher or it will not work. Now you have two choices. You can either connect the PS4 signal to your laptop via HDMI out, or you can use it HDMI out and connect it to a TV. With the latter option, you can see the PS4 signal on your TV as usual. If you don't have a second screen or TV, you'll need to view the game through the download program. We'll cover it next. Record or stream with an Elgato HD60S Now that you have elgato HD60S connected to your laptop correctly, it's time to set up the streaming software. I recommend using OBS Studio. You can download it here. On NOTE, click + under the Sources box and select the Video Capture Device option. Next, you need to select Elgato Game Capture HD from the device drop-down menu. NOTE will now download the video from your console. Finally, in order for OBS to retrieve the audio, you need to right-click the new Video Capture Device in your source box in OBS and click Properties. Scroll to the bottom of the property panes and click the Sound Output Mode drop-down list. Select 'Output desktop audio (WaveOut)'. There are now two different ways to take: If you connected HDMI to your laptop: you're good to go - you can start recording or streaming as usual and all audio and video can be viewed via OBS Studio. Press F11 to see it in full-screen mode. If you connected HDMI to another display: screen: need to connect your headphones to the audio port of the Elgato HD60S to hear the sound. If you are new to OBS, there are two main things to consider. Firstly, if you are only recording, you can click the settings button in the lower right of OBS and then click on the Output tab. From here, make sure that the recording format is set to MP4. To stream, click Settings and use the power tab. Some services, such as Twitch, allow you to log in directly through OBS. Other services require you to copy and paste the power key from the dashboard of your streaming account. Once you've set up, all you have to do is click Start Streaming or Start Recording from the main OBS dashboard to begin. If you want, you can click to record and stream at the same time.
